

Corresponding Dock Bumper Parts

Please note: hanging the docks to the corresponding plates will require M24 threading which is also available to purchase on our site. We supply lengths of 90mm, 100mm, 120mm, 150mm and 300mm.

- **Front Plate** – Adding a stainless-steel front plate will prevent wear to the rubber component whilst still allowing for the same level of compression.
- **Packer Plate** – An extra layer of rubber that optimises the dock bumper to suit the desired dimension. Please note, some packers require holes to be drilled.
- **Back Plate** – Whilst the rubber bumpers can be fixed directly to the wall or dock leveller, it is highly recommended to use a metal backing plate. This improves the structural integrity of the buffer and makes it very easy to replace.
